

SentinelPro

For Commercial Beekeepers

Have you heard about the **BIP Sentinel Apiary Program?**
We've now expanded our program to serve commercial operations!

BIP Sentinel Apiary Program is our most **"bang for your buck"** apiary health tracking program, providing reliable, longitudinal data on eight tagged colonies over the course of a season and even year after year.

You get six monthly reports (from May to October), providing apiary insight through colony assessment metrics, lab disease diagnostics, and comparisons to other regional participants.

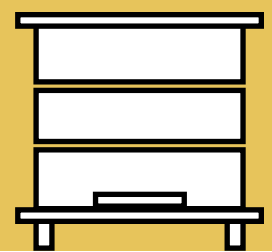

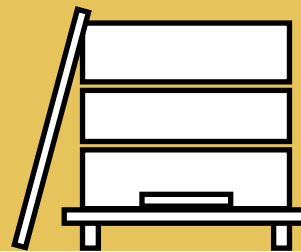

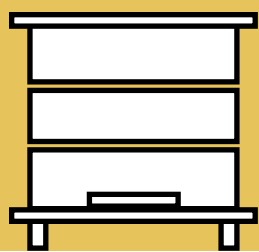

By monitoring the same eight colonies monthly, Sentinel reports give you **actionable, current** data on how your colonies are faring through the season. This can **save you money** by helping you apply treatment when and where it is needed.

You can use these results to understand how your apiary health varies by:

- management practice, feed, and other
- treatment
- yards or groups
- pollination events

SentinelPro options:
Mobile or Stationary.

With both, you can compare data and observe the effects of migration, pollination, location, etc...

Program reports include ...

- *General colony assessments:*
 - Queen Status
 - Frames of Bees
 - Treatment & Management records
 - Overt Disease Observations
- *Lab diagnostics:*
 - *Varroa* mite loads
 - *Nosema* spores loads
- *Regional comparisons* with other commercial SentinelPro participants

It is easy and quick: We can train your crew to sample or we can do it for you! *Kits include everything to get started sampling.*

Stationary Sentinel

Best for non-migratory operations looking to get a pulse on their apiaries and understand the effectiveness of their management techniques.

Mobile Sentinel

Best for migratory operations looking to keep track of apiary health through pollination events and location changes.
